```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Transgenic plants in which a DNA sequence has been integrated, also their cell cultures, organs, tissues etc. are useful in human or animal nutrition, to produce seeds, and to produce pharmaceuticals or fine chemicals, e.g. enzymes, vitamins, amino acids, flavourings and aromatizing agents, dyes, antibodies and vaccines. The present sequence is a recognition sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Site-specific integration of DNA into plastid DNA, useful for making transgenic plants used e.g. as food, by recombinase-mediated insertion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ΰ
```

one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (1) a platform artificial chromosome expression system (ACes) (11) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial

Sequence 248 BP; 76 A; 35 C; 34 G; 103 T; 0 U; 0 Other;

The present invention describes a eukaryotic chromosome (1) comprising

chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes oselected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, KNA, KNA, structural proteins, marker proteins, ligands, receptors, iboozymes, therapeutic proteins, and proteins, antisense RNA, trons, structural proteins, and proteins, antisense provents, antisense, horodicated actors, antisense, horodicated actors, antisense, horodicated actors, antisense, in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (RAC). This producing plant artificial chromosomes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TITIACAGIAITATGIAGICTGIITITIAIGCAAAAICIAAITIAAIAITATAITA 120

The sequences given in ABQ80104-05 are primers which were used to amplify DNA for use in the material of the invention. The primers amplify a 1377 DNA for use in the material of the invention. The printion of lambda phage DNA contained in a plasmid. The amplified sequence (ABQ80306) was attached to the printer material of the invention which comprises at least one support having at least one oligomer and/or contained on it. The printed material is useful in a method for synthesising DNA where the product of amplification and/or ligation is contained on it insertion/deletion, single nucleotide contained insertion/deletion, or SNP andlysis. Continually, the CNA and/or full-length CDNA is useful for the peptide or protein expression. The printed material is useful in research applications, or for providing scientists with oligomer and/or polymers from the printed materials alless and/or polymer can be obtained immediately and directly, without need to make a request for it. The coligomers and/or polymers and/or polymers can be delivered and stored easily with reduced labour and time while eliminating the need to use special equipment or the contained are and the printed material is a safety and directly, without need to make a request for it. The coligomer and time while eliminating the need to use special equipment or the coligomer and time while eliminating the need to use special equipment or the coligomer and time while eliminating the need to make a request for it.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of removing a transgene marker by flanking the transgene with a bacteriophage lambda attachment P (attP) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antibbotic resistance. The present sequence is the attP coding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       198

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                             oligomer and/or polymer applied on support. The support has oligomer and/or polymer applied on it, and is in the form of loose-leaf sheet or card. The support is useful for storing and/or delivering an oligomer and/or polymer applied on it. The present sequence is Bacteriophage lambda DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                New support useful for storing and/or delivering an oligomer and/or polymer applied on support, has oligomer and/or polymer applied on it, and a loose-leaf sheet or a card.

clone R280. An IEG is a game whose expression is rapidly increased immediately following a stimulus e.g., neuronal stimulation. Such neuronal IEGs have been found to encode a variety of proteins, including transcription factors, cytoskeletal proteins, growth factors and metabolic enzymes, as well as proteins involved in signal transduction. The identification of neuronal IEGs and the proteins they encode may provide important information about the function of neurons in, for example, learning, memory, synaptic transmission, tolerance and neuronal EGS and antibodies against neuronal IEG proteins can be used to treat an animal with a deficiency in neuronal IEG responsivity to stimuli, such that the effect of the deficiency is minimised. The deficiency may be a reduced or elevated level of expression of an IEG. The neuronal stimulus comprises a maximal electroconvulsive seizure and its effects influence learning or memory. The IEGs and products are useful in identifying compounds that modulate the expression or accountly of IEG nucleic acids or proteins, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombination, and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome, preferably an ACes. (II) is useful for producing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4070 TCTGTTACAGGTCACTAATACCATCTAAGTAGTTGATTCATAGTGACTGCATATGTTGTG 4129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 TATCATTTTACGTTTCTCGTTCAGCTTTTTTATACTAGTTGGCATTATAAAAAAGCATT 180

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods insertion of heterologous DNA into plant artificial chromosomes. The isolated plant chromosomes one elected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product cuch as enzymes, antisense RNA, tRNA, tNNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and biopharmaceutical proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (EAC) or a yeast artificial chromosome (EAC) or a yeast artificial chromosome (EAC).

The polypeptide monomers are variants based on a consensus sequence derived from the fibre forming regions of spider dragline protein, esp. the natural protein 1 (Spidroin 1) from Nephila clavibes. Synthetic analogues of DPI

were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. DP-1A analogues are composed of a tandemly repeated 101 amino acid monomer which comprises four repeats which differ from the consensus sequence given in AAW06201, according to the pattern (1)-(5): (1) the poly-alanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence is deleted, so also is the surrounding sequence encompassing AGRGGLGGCAAAGG; (3) aside from the poly-alanine sequence residues; (4) deletion of GYG is an entire poly-alanine sequence; and (5) a repeat in which the entire poly-alanine sequence; and (5) a repeat in which the entire poly-alanine sequence; a deleted is generally perceded by a repeat containing six alanine residues. The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4822
                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of vector plasmid pJMF3, which includes byage landed attre and the lac promoter with the first 21 amino acids of lack—alpha (from plasmid pUC19) fused in-frame to the Vibrio harveyi chitobiase gene (see AAB20484). The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. A claimed reporter gene construct comprises pJMF3. The invention also comprises expression vectors which express the cytoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
                                                                                                                                                                                                                                                                                                                           Identifying a regulatory element capable of directing or regulating transcription (e.g. a promoter) comprises providing a construct linked to a nucleic acid encoding a cytoplasmic form of chitobiase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        form of chitobiase. Methods are provided for: characterizing a promoter; identifying a regulatory element capable of directing and regulating transcription within a test sequence; detecting a successful transformation; and for monitoring the activity of a promoter. Chitobiase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   has an advantage over beta-galactósidase as a reporter gene in that it is not necessary to engineer many host cells to lack reporter activity. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4763 TTTTACAGTATTATGTAGTCTGTTTTTTATGCAAAATCTAATTTAATATATTGATATTTA

Identifying a regulatory element capable of directing or regulating transcription (e.g. a promoter) comprises providing a construct linked to a nucleic acid encoding a cytoplasmic form of chitobiase.
                                                                                                                                                                                                                                                                                                                 The present sequence is that of vector plasmid pJMF4, which includes phage lambda attP and the lac promoter with the first 21 amino acids of lac2-alpha (from plasmid pUCl9) fused in-frame to the Vibrio harveyi chitobiase gene (see AAB20484). The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. A claimed reporter gene construct comprises pJMF4. The invention also comprises expression vectors which express the cytoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcription within a test sequence, detecting a successful transformation, and for monitoring the activity of a promoter. Chitobiase has an advantage over beta-galactosidase as a reporter gene in that it is not necessary to engineer many host cells to lack reporter activity. The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. The invention also comprises expression vectors which express the cytoplasmic form of chitobiase. Methods are provided for: characterizing a promoter; identifying a regulatory element capable of directing and regulating transcription within a test sequence; detecting a successful transformation, and for monitoring the activity of a promoter. Chitobiase has an advantage over beta-galactosidase as a reporter gene system in that it is not necessary to engineer many host

The present sequence is that of vector plasmid pDXXII, which comprises the Vibrio harveyi chitobiase gene under the control of the Escherichia coli rpmH-dnah promoter in plasmid pACYC184. The plasmid encodes a dnah-chitobiase fusion protein (see AAB20485). It was used to assess the regulation of the dnah gene using chitobiase as a reporter enzyme. A claimed reporter gene construct comprises pDXXII. The invention relates to genetic constructs and methods of using a cytoplasmic form of chitobiase enzyme as a reporter. The invention also comprises expression cotors which express the cytoplasmic form of chitobiase. Methods are provided for: characterizing a promoter, identifying a regulatory element capable of directing and regulating transcription within a test sequence, detecting a successful transformation; and for monitoring the activity of a promoter. Chitobiase has an advantage over beta-galactosidase as a reporter gene in that it is not necessary to engineer many host cells to lack reporter activity. (Updated on 11-SEP-2003 to standardise of field)

/gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Gigapack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-Zap XR vector using ExAssist
helper phage and the E. coli strain XLI-Blue MRF'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GSS 14-AUG-2000

/note="Vector: Lambda Zap; Seedlings were exposed either
/note="Tector: Lambda Zap; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni: Zap XR vector (Stratagene) and
packaged using the Gigapack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-ZAP XR vector using ExAssist
helper phage and the E. coli strain XLI-Blue MRF'
(Stratagene). Excised plasmids were plated using SOLR
cells."
